# Predict Disease And Get Cure

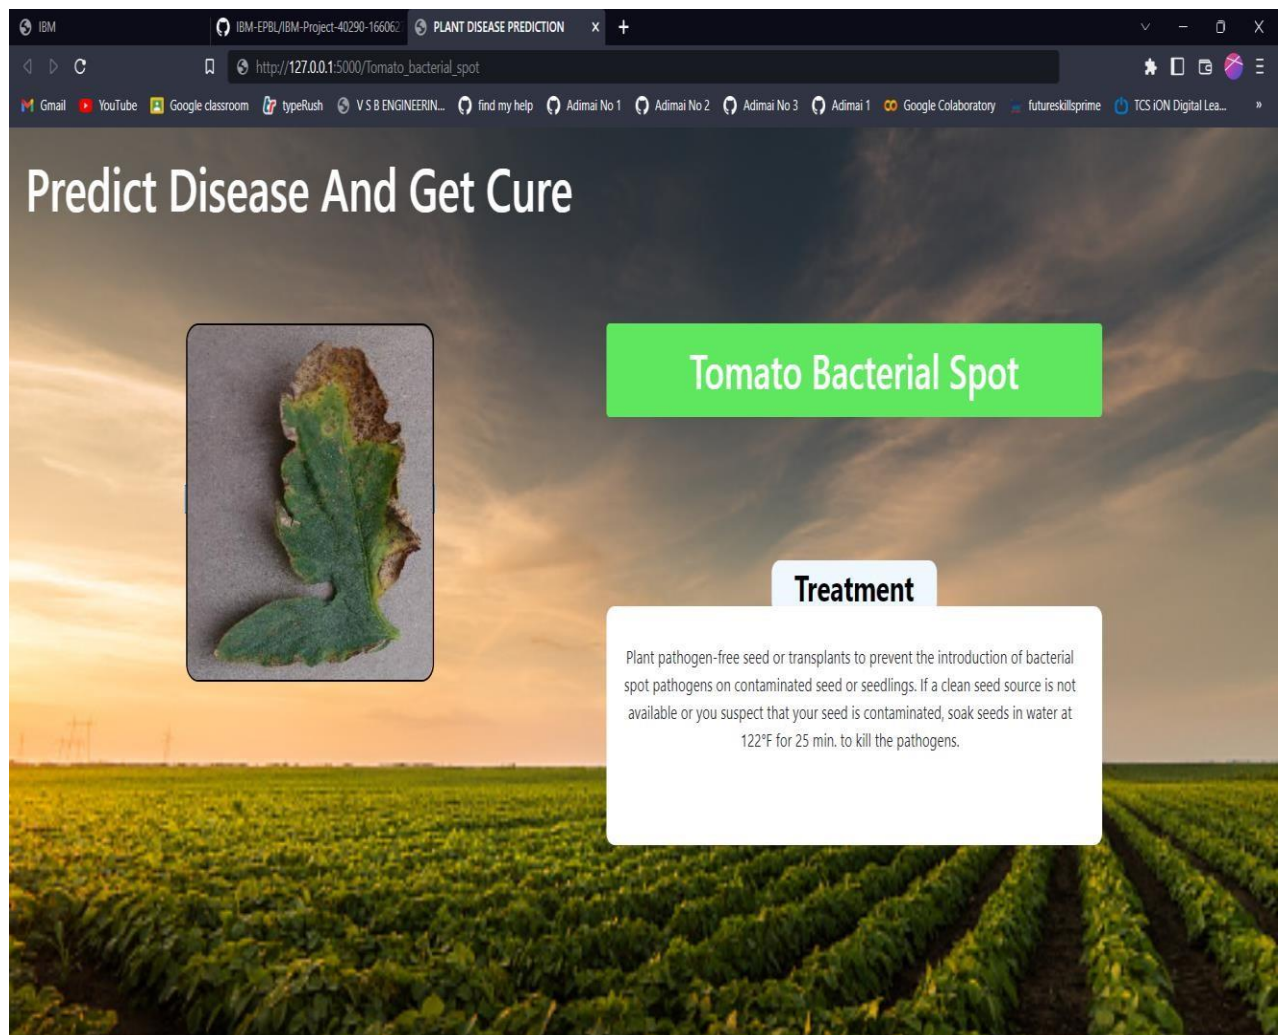

## Peach Bacterial Spot

### Treatment

The best strategy is to use cultivars with better bacterial spot resistance. This is especially true for orchards in sandy sites prone to the disease. Varieties developed by breeding programs in wet, sandy regions will tend to have better bacterial spot resistance than those developed for dry regions such as California.

A variety with moderate resistance to bacterial spot may do well in a site sheltered from wind but have unacceptable symptoms in a bacterial spot-prone site or if planted with highly susceptible varieties.

### 3.PREDICTING THE VEGETABLE LEAF:

The screenshot shows a web browser window with the title "PLANT DISEASE PREDICTION". The address bar displays the URL "http://127.0.0.1:5000/Tomato\_bacterial\_spot". The page features a background image of a tomato field at sunset. On the left, there is a close-up image of a tomato leaf with brown, necrotic spots. To the right of this image, a green button displays the text "Tomato Bacterial Spot". Below this button, a white box titled "Treatment" contains the following text: "Plant pathogen-free seed or transplants to prevent the introduction of bacterial spot pathogens on contaminated seed or seedlings. If a clean seed source is not available or you suspect that your seed is contaminated, soak seeds in water at 122°F for 25 min. to kill the pathogens."
